

## Percent of Children Ever Infected with Novel Coronavirus Estimated,\* US Regions, August 3, 2020

National Average = 3.3%

**Notes:** Cumulative infections include children who have recovered. These estimates are derived from pediatric intensive care unit admissions, a measure of critically-ill children. Because not all PICU hospitals participate in the voluntary COVID-19 PICU registry ([myvps.org](http://myvps.org)), our tallies of PICU patients underestimate the true counts. Consequently, these estimates of total percent infected are also lower than true according to our method.

\* See [Pathak et al 2020](#) for methods.
